Title: Enzyme granulate

FIELD OF THE INVENTION

The invention relates to novel enzyme granule products containing a concentrated enzyme core and to processes for the production of the enzyme granules.

BACKGROUND OF THE INVENTION

Known enzyme granule formulation technologies include:

a) Spray dried products, wherein a liquid enzyme-containing solution is atomised in a spray drying tower to form small droplets which during their way down the drying tower dry to form an enzyme-containing particulate material. Very small particles can be produced this way (Michael S. Showell (editor); *Powdered detergents*; Surfactant Science Series; 1998; vol. 71; page 140-142; Marcel Dekker).

b) Layered products, wherein the enzyme is coated as a layer around a pre-formed inert core particle, wherein an enzyme-containing solution is atomised, typically in a fluid bed apparatus wherein the pre-formed core particles are fluidised, and the enzyme-containing solution adheres to the core particles and dries up to leave a layer of dry enzyme on the surface of the core particle. Particles of a desired size can be obtained this way if a useful core particle of the desired size can be found. This type of product is described in e.g. WO 97/23606

c) Absorbed core particles, wherein rather than coating the enzyme as a layer around the core, the enzyme is absorbed onto and/or into the surface of the core. Such a process is described in WO 97/39116.

d) Extrusion or pelletized products, wherein an enzyme-containing paste is pressed to pellets or under pressure is extruded through a small opening and cut into particles which are subsequently dried. Such particles usually have a considerable size because of the material in which the extrusion opening is made (usually a plate with bore holes) sets a limit on the allowable pressure drop over the extrusion opening. Also, very high extrusion pressures when using a small opening increase heat generation in the enzyme paste, which is harmful to the enzyme. (Michael S. Showell (editor); *Powdered detergents*; Surfactant Science Series; 1998; vol. 71; page 140-142; Marcel Dekker)

e) Prilled products or, wherein an enzyme powder is suspended in molten wax and the suspension is sprayed, e.g. through a rotating disk atomiser, into a cooling chamber where the droplets quickly solidify (Michael S. Showell (editor); *Powdered detergents*; Surfactant Science Series; 1998; vol. 71; page 140-142; Marcel Dekker). The product obtained is one wherein the enzyme is uniformly distributed throughout an inert material instead of being concentrated on its surface. Also US 4,016,040 and US 4,713,245 are documents relating to this technique

f) Mixer granulation products, wherein an enzyme-containing liquid is added to a dry powder composition of conventional granulating components. The liquid and the powder in a suitable proportion are mixed and as the moisture of the liquid is absorbed in the dry powder, the components of the dry powder will start to adhere and agglomerate and particles will build up, forming granulates comprising the enzyme. Such a process is described in US 4,106,991 (NOVO NORDISK) and related documents EP 170360 B1 (NOVO NORDISK), EP 304332 B1 (NOVO NORDISK), EP 304331 (NOVO NORDISK), WO 90/09440 (NOVO NORDISK) and WO

90/09428 (NOVO NORDISK). In a particular product of this process wherein various high-shear mixers can be used as granulators, granulates consisting of the enzyme, fillers and binders etc. are mixed with cellulose fibres to reinforce the particles to give the so-called T-granulate. Reinforced particles, being more robust, release less enzymatic dust (*vide infra*).

SUMMARY OF THE INVENTION

The present invention relates to an enzyme-containing granule comprising a core unit and a shell unit, wherein the core unit comprises the enzyme and is enclosed in a shell unit which is substantially enzyme-free, the ratio between the diameter of the granule and the diameter of the core unit being at least 1.1.

In a second aspect, the invention relates to a process for preparing enzyme core units and finished enzyme granules, comprising the enzyme core unit and the shell unit. The invention further relates to compositions comprising the enzyme granule such as foodstuff/baking/flour/dough compositions or detergent composition and the use of such compositions in application.

DETAILED DESCRIPTION OF THE INVENTION

Definitions

30 The phrase "ratio between the diameter of the granule and the diameter of the core unit and" (hereinafter abbreviated D_g/D_c) as used herein is to be understood as the diameter of the granule comprising a core unit and a shell unit divided by the diameter of the core unit only. If for example a core unit

having a diameter of 100 μm is coated with a coating layer 200 μm thick, the granule would have a diameter of $(200+100+200)=500$ μm and D_g/D_c is $500 \mu\text{m}/100 \mu\text{m} = 5$.

5 The term "activity" when used in reference to an enzyme preparation or with reference to an enzyme granule or an enzyme core is a relative measure of the ability of the enzyme in the preparation, granule or core to react with a standard substrate at fixed standard conditions. Activity is measured in units
10 which is defined as μmoles of substrate reacted per minute per gram of the measured sample at fixed standard conditions (herein after "a standard assay"). The activity is also a measure of the amount of active enzyme protein. An enzyme has a specific activity which is the activity of the pure enzyme
15 protein in the standard assay. The specific activity is also measured in units which is defined as μmoles of substrate reacted per minute per gram of pure enzyme at fixed standard conditions. When the specific activity of an enzyme is known the amount of pure enzyme protein in a sample can be
20 calculated. If a 1 gram sample of a pure enzyme react with 100 μmoles of a substrate per minute in a standard assay, the specific activity of the enzyme is 100 Units per gram pure enzyme. If a 1 gram sample of unknown enzyme activity reacts with 50 μmoles of a substrate per minute in the standard assay,
25 the activity of the sample is 50 Units per gram and there is 0.5 g of pure enzyme protein in the sample.

It is to be understood that the term "size" of particles or granulates covers the diameter of a particle measured in the
30 longest dimension of the particle or granulate. Also, the mean size of granules is to be understood as the mean diameter of granules manufactured by the process of the invention measured in the longest dimension of the particles. The term "particle size distribution" is meant to be understood the range of sizes

of granules resulting from a particular process; the spectrum or gradient distribution of granules with regards to their diameter.

5 The particle size distribution (PSD) can be expressed in terms of the mass mean diameter of the individual particles. A mean mass diameter of D50 is the diameter at which 50% of the granules, by mass, have a smaller diameter, while 50% by mass have a larger diameter. The values D10 and D90 are the
10 diameters at which 10% and 90%, respectively, of the granules, by mass, have a smaller diameter than the value in question. The "span" indicates the breadth of the PSD and is expressed as:

$$(D90 - D10) / D50.$$

15 For purposes of the present invention, the particle size distribution is normally as narrow as possible. The span of a granulate product according to the invention is therefore typically not more than about 2.5, preferably not more than about 2.0, more preferably not more than about 1.5, and most
20 preferably not more than about 1.0.

The terms "particle" and "granulate" or "granule" are to be understood as predominantly spherical or near spherical structures of a macromolecular size.

25

The term "substantially enzyme free " as used herein about a shell unit means that there less than 5 mg of enzyme per gram shell.

30

The Granule

In enzyme granules of the invention, enzymatic activity is concentrated into a central core unit surrounded a shell unit or coating which is substantially enzyme free. The core unit is

smaller than core units known to the art and the shell unit is thicker than shell units known to the art and in order to provide enzyme granules having a total activity useful in established applications of enzyme granules the enzyme activity
5 in the core unit is considerably augmented. The smaller enzyme cores of the invention, which can be prepared having a very narrow particle size distribution provides new and flexible preparation ways of controlling the activity by independently varying the size of the enzyme core and the thickness of the
10 surrounding shell. Moreover, the enzyme granules of the invention have environmentally advantageous properties such as low dust and odour levels, reduced contents of granulate additive and improved storage stability of the enzyme. The products may have a natural white colour circumventing the need
15 for expensive and environmentally antagonistic pigments such as titanium dioxide pigments in additional coatings.

The granule of the invention is characterised by having a structure wherein D_g/D_c is at least 1.1, which means that the thickness of the shell unit is at least 5% of the core unit
20 diameter. The more the enzyme activity can be concentrated in the core unit, the smaller the core unit can be made, and the thicker the shell unit can be made, when preparing a granule of a desired fixed activity. Smaller core units improves the granule properties and increase flexibility in the preparation
25 of the granules. Accordingly in a preferred embodiment D_g/D_c for the granule is at least about 1.5, preferably at least about 2, more preferably at least about 3, most preferably at least about 4. D_g/D_c is however preferably below about 100, preferably below about 50, more preferably below 25, and most
30 preferably below 10. A most preferred range for D_g/D_c is about 4 to about 6.

In certain embodiments the enzyme granule, the enzyme core further comprises a film layer around the core unit to protect the core unit from components present in the shell unit. This

protective outer film layer may also serve other purposes such as for stability of both the enzyme itself and the structural integrity of the unit, and for storage purposes.

5 The Enzyme Core Unit

Enzymes of the present invention are situated within the enzyme core unit. The enzyme core unit is designed to be as small in size as possible but to include a necessary amount of enzyme for the purpose of the granulate, as well as components useful
10 for providing structural stability of the enzyme core unit and/or physical and chemical stability of the enzyme itself. Thus, the enzyme core unit will comprise at least one enzyme and optionally one or more excipients or additives.

Given that one advantage sought after by the present
15 invention is to limit the dispersion or distribution of expensive additives, such as enzyme stabilising agents only to a small fraction of the granulate, preferred embodiments of the granulate limit the size of the core unit, in terms of its relative mass, to comprise up to about 30%, such as up to about
20 20% of the overall mass of the granulate, such up to about 15%, preferably up to about 10%, such as 5% of the overall mass.

The size of the enzyme core unit, in terms of its diameter in its longest dimension, in preferred embodiments of the invention, is no more than 1000 μm , preferably no more than 700
25 μm or 600 μm , preferably between 100 and 500 μm , such as between 100 and 400 μm , preferably between 200 and 300 μm . In relation to the overall diameter of the granulate, its diameter is intended to be less than that of the shell unit and being the diminutive of the two units with regards to the overall
30 diameter of the of the granulate.

The intention is to concentrate the enzyme content to a small fraction of the overall granulate. This small fraction, herein termed the enzyme core unit, although intended to be small in size, must at least be large enough to prevent its

agglomeration with other enzyme core units during the granulation process by shell coating components. To prevent agglomeration of the enzyme core unit during further processing however, the size of the enzyme core unit is preferably greater than 50 μm , such as greater than 100 μm . This may correspond to an enzyme core unit of at least 1% by weight of the total mass, such as at least 2%, such as at least 5% or 10% of the total mass.

An integral feature of the present invention is that enzyme activity is limited solely to the core unit. No other moiety or component of the granule as defined by this invention is intended to contain enzymes. As is known by the person skilled in the art however, the enzyme may be dispersed or diffused elsewhere during the use of the final granulate.

The physical state of the enzyme core can be that of a solid, liquid, or gel.

Preferable embodiments of the invention comprise a solid enzyme core unit. In one embodiment of the invention, the enzyme core unit is solid when encased in its shell unit. Thereafter, the enzyme granule can be heated above the melting point of the binders or other components of the enzyme core so as to cause these components to diffuse into the inner parts of the shell unit resulting in an increase porosity of the enzyme core. This will in turn increase the solubility of the core unit.

Enzymes

The enzyme in the context of the present invention may be any enzyme or combination of different enzymes. Accordingly, when reference is made to "an enzyme" this will in general be understood to include both a single enzyme and a combination of more than one enzyme.

It is to be understood that enzyme variants (produced, for example, by recombinant techniques) are included within the

meaning of the term "enzyme". Examples of such enzyme variants are disclosed, e.g., in EP 251,446 (Genencor), WO 91/00345 (Novo Nordisk), EP 525,610 (Solvay) and WO 94/02618 (Gist-Brocades NV). The enzyme classification employed in the present
5 specification and claims is in accordance with *Recommendations (1992) of the Nomenclature Committee of the International Union of Biochemistry and Molecular Biology*, Academic Press, Inc., 1992.

Accordingly the types of enzymes which may appropriately
10 be incorporated in granules of the invention include oxidoreductases (EC 1.---), transferases (EC 2.---), hydrolases (EC 3.---), lyases (EC 4.---), isomerases (EC 5.---) and ligases (EC 6.---).

Preferred oxidoreductases in the context of the invention
15 are peroxidases (EC 1.11.1), laccases (EC 1.10.3.2) and glucose oxidases (EC 1.1.3.4)], while preferred transferases are transferases in any of the following sub-classes:

- a) Transferases transferring one-carbon groups (EC 2.1);
- 20 b) Transferases transferring aldehyde or ketone residues (EC 2.2); acyltransferases (EC 2.3);
- c) Glycosyltransferases (EC 2.4);
- d) Transferases transferring alkyl or aryl groups, other than methyl groups (EC 2.5); and
- 25 e) Transferases transferring nitrogenous groups (EC 2.6).

A most preferred type of transferase in the context of the invention is a transglutaminase (protein-glutamine γ -glutamyltransferase; EC 2.3.2.13).

30

Further examples of suitable transglutaminases are described in WO 96/06931 (Novo Nordisk A/S).

Preferred hydrolases in the context of the invention are: Carboxylic ester hydrolases (EC 3.1.1.-) such as lipases (EC 3.1.1.3); phytases (EC 3.1.3.-), e.g. 3-phytases (EC 3.1.3.8) and 6-phytases (EC 3.1.3.26); glycosidases (EC 3.2, which fall
5 within a group denoted herein as "carbohydases"), such as α -amylases (EC 3.2.1.1); peptidases (EC 3.4, also known as proteases); and other carbonyl hydrolases].

In the present context, the term "carbohydase" is used to
10 denote not only enzymes capable of breaking down carbohydrate chains (e.g. starches) of especially five- and six-membered ring structures (i.e. glycosidases, EC 3.2), but also enzymes capable of isomerizing carbohydrates, e.g. six-membered ring structures such as D-glucose to five-membered ring structures
15 such as D-fructose.

Carbohydases of relevance include the following (EC numbers in parentheses):

α -amylases (3.2.1.1), β -amylases (3.2.1.2), glucan 1,4- α -
20 glucosidases (3.2.1.3), cellulases (3.2.1.4), endo-1,3(4)- β -glucanases (3.2.1.6), endo-1,4- β -xylanases (3.2.1.8), dextranases (3.2.1.11), chitinases (3.2.1.14), polygalacturonases (3.2.1.15), lysozymes (3.2.1.17), β -glucosidases (3.2.1.21), α -galactosidases (3.2.1.22), β -
25 galactosidases (3.2.1.23), amylo-1,6-glucosidases (3.2.1.33), xylan 1,4- β -xylosidases (3.2.1.37), glucan endo-1,3- β -D-glucosidases (3.2.1.39), α -dextrin endo-1,6- α -glucosidases (3.2.1.41), sucrose α -glucosidases (3.2.1.48), glucan endo-1,3- α -glucosidases (3.2.1.59), glucan 1,4- β -glucosidases
30 (3.2.1.74), glucan endo-1,6- β -glucosidases (3.2.1.75), arabinan endo-1,5- α -L-arabinosidases (3.2.1.99), lactases (3.2.1.108), chitosanases (3.2.1.132) and xylose isomerases (5.3.1.5).

Examples of commercially available oxidoreductases (EC 1.-.-.-) include Gluzyme™ (enzyme available from Novo Nordisk A/S).

Examples of commercially available proteases (peptidases) include Kannase™, Everlase™, Esperase™, Alcalase™, Neutrase™, Durazym™, Savinase™, Pyrase™, Pancreatic Trypsin NOVO (PTN), Bio-Feed™ Pro and Clear-Lens™ Pro (all available from Novo Nordisk A/S, Bagsvaerd, Denmark).

Other commercially available proteases include Maxatase™, Maxacal™, Maxapem™, Opticlean™ and Purafect™ (available from Genencor International Inc. or Gist-Brocades).

Examples of commercially available lipases include Lipoprime™ Lipolase™, Lipolase™ Ultra, Lipozyme™, Palatase™, Novozym™ 435 and Lecitase™ (all available from Novo Nordisk A/S).

Other commercially available lipases include Lumafast™ (*Pseudomonas mendocina* lipase from Genencor International Inc.); Lipomax™ (*Ps. pseudoalcaligenes* lipase from Gist-Brocades/Genencor Int. Inc.; and *Bacillus* sp. lipase from Solvay enzymes. Further lipases are available from other suppliers.

Examples of commercially available carbohydrases include Alpha-Gal™, Bio-Feed™ Alpha, Bio-Feed™ Beta, Bio-Feed™ Plus, Bio-Feed™ Plus, Novozyme™ 188, Celluclast™, Cellusoft™, Ceremyl™, Citrozym™, Denimax™, Dezyme™, Dextrozyme™, Finizym™, Fungamyl™, Gamanase™, Glucanex™, Lactozym™, Maltogenase™, Pentopan™, Pectinex™, Promozyme™, Pulpzyme™, Novamyl™, Termamyl™, AMG™ (Amyloglucosidase Novo), Maltogenase™, Sweetzyme™ and Aquazym™ (all available from Novo Nordisk A/S). Further carbohydrases are available from other suppliers.

The enzyme content (calculated as pure enzyme protein) in a core unit of the invention will typically be in the range of from about 20% to 100% by weight of the enzyme core unit, preferably no less than 25%, such as no less than 30%, 35%, 40%, 45%, 50%, 55%, 60%, 65%, 70%, 75%, 80%, 85%, 90%, or 95% by weight .

However some enzymes have a very high specific activity so that less enzyme protein by weight is required to maintain a high activity of the core unit. Accordingly for e.g. a protease a preferred core activity is at least 60 KNPU per gram core, more preferably at least 100 KNPU, more preferably at least 200 KNPU or most preferably at least 250 KNPU per gram core. The unit for protease activity used herein is Kilo Novo Protease Units per gram of sample (KNPU/g). The enzyme activity is determined in a standard assay by measuring for a given amount of core the formation rate ($\mu\text{mol/minute}$) of free amino groups liberated from digestion of di-methyl-casein (DMC) in solution by the enzyme. The formation rate is monitored by recording the linear development of absorbance at 420 nm of the simultaneous reaction between the formed free amino groups and added 2,4,6-tri-nitro-benzene-sulfonic acid (TNBS). The digestion of DMC and the colour reaction is carried out at 50°C in a pH 8.3 boric acid buffer with a 9 min. reaction time followed by a 3 min. measuring time. A folder AF 220/1 is available upon request from Novo Nordisk A/S, Denmark, which folder is hereby incorporated by reference.

Generally, for all enzymes a preferred core activity is at least the activity which can be measured for a core having more than 20% w/w of a known enzyme using known methods.

Preferably the enzyme in a crystalline or amorphous form is homogeneously distributed or dispersed within the core unit.

The enzyme content of a finished granule (coated) will be considerably lower. The protease content in a finished granule will for example typically be in the range of 1-20 KNPU/g,

while for an. α -amylase an activity of 10-500 KNU/g will be typical. For e.g. lipases, an activity in the range of 50-400 KLU/g will normally be suitable.

The choice of enzyme or enzymes is dependent on the end
5 purpose of the granulate. The term "enzyme" and some preferred examples of the term were defined earlier (*vide supra*). One or more enzymes or enzyme types, optionally requiring co-enzymes, optionally as part of a multi-enzyme complex, optionally as a zymogen, can be in the enzyme core unit.

10

One embodiment of this aspect of the invention comprises a structured enzyme core unit whereby enzyme-containing particles are clustered within the enzyme core unit to form a clustered-particle core unit. Particles may each contain the same or
15 different enzymes and may be optionally coated. An alternative embodiment of a structured enzyme core unit is that of a layered enzyme core unit whereby an enzyme containing core is layered with enzyme-containing layers to form a multi-layered enzyme core unit. Granules comprising of a structured core unit
20 are termed co-granules, in that they comprise two or more different enzymes, enzyme types and/or enzymatic activities in one granule. Such co-granules are commercially interesting in part because they minimise the amount shell unit materials. Typical co-granules have protease and amylase activities, but
25 other combinations, such as protease-lipase-carbohydrase and many other combinations of 2 or 3 activities and/or enzymes are also possible. Co-granules can be as layered structures or as clustered-particle structures.

30 Excipients

The enzyme core unit can comprise excipients or additives, which may serve a specialised function in the core unit. Excipients may be compounds conventionally used in the art, and may be selected from the non limiting group of:

- Enzyme stabilising agents. Enzyme stabilising or protective agents such as conventionally used in the field of granulation may be elements of the enzyme-containing unit. Stabilising or protective agents may fall into several categories: alkaline or neutral materials, reducing agents, antioxidants and/or salts of first transition series metal ions. Each of these may be used in conjunction with other protective agents of the same or different categories. Examples of alkaline protective agents are alkali metal silicates, carbonates or bicarbonates which provide a chemical scavenging effect by actively neutralising e.g. oxidants. Examples of reducing protective agents are salts of sulfite, thiosulfite or thiosulfate, while examples of antioxidants are methionine, butylated hydroxytoluene (BHT) or butylated hydroxyanisol (BHA). Most preferred agents are salts of thiosulfates, e.g. sodium thiosulfate or methionine. Also enzyme stabilizers may be borates, borax, formates, di- and tricarboxylic acids and reversible enzyme inhibitors such as organic compounds with sulfhydryl groups or alkylated or arylated boric acids. Examples of boron based stabilizer may be found in WO 96/21716, whereas a preferred boron based stabilizer is 4-Formyl-Phenyl-Boronic Acid or derivatives thereof described in WO 96/41859 both disclosed incorporated herein by reference. Still other examples of useful enzyme stabilizers are gelatine, casein, Poly vinyl pyrrolidone (PVP) and powder of skimmed milk. Enzyme stabilising agents may constitute be 0.01-10% w/w of the core unit, preferably 0.1-5%, e.g. 0.5-2.5% w/w of the core unit.

- Solubilising agents. The solubility of the enzyme core unit is especially critical in cases where the unit is a

component of detergent formulation. As is known by the person skilled in the art, many agents, through a variety of methods, serve to increase the solubility of formulations, and typical agents known to the art can be found in national Pharmacopeia's. Thus, the enzyme core unit may optionally comprise any agent that serves to enhance the solubility of the enzyme core unit. These agents usually cause the formulation to swell upon contact with water, or to disintegrate, rupture, burst or break open.

- Inorganics, such as water soluble and/or insoluble inorganic salts such as finely ground alkali sulphate, alkali carbonate and/or alkali chloride, clays such as kaolin (e.g. Speswhite™, English China Clay), bentonites, talcs, zeolites, calcium carbonate, and/or silicates.
- Binders, e.g. binders with a high melting point or indeterminately high melting points and of a non-waxy nature, e.g. polyvinyl pyrrolidone, dextrans, polyvinylalcohol, cellulose derivatives, for example hydroxypropyl cellulose, methyl cellulose or CMC. A suitable binder is a carbohydrate binder such as Glucidex 21D™ available from Roquette Freres, France.
- Waxes, such as organic compounds having a melting temperature of 25-150°C, preferably 35-80°C. Suitable waxes includes Poly ethylene glycols; polypropylenes or polyethylenes or mixtures thereof; Nonionic surfactants; Waxes from natural sources such as Carnauba wax, Candelilla wax, bees wax, hydrogenated plant oil or animal tallow; fatty acid alcohols; mono-glycerides and/or di-glycerides; fatty acids and paraffines.

- Fibre materials such as pure or impure cellulose in fibrous form. This can be sawdust, pure fibrous cellulose, cotton, or other forms of pure or impure fibrous cellulose. Also, filter aids based on fibrous cellulose can be used. Several brands of cellulose in fibrous form are on the market, e.g. CEPO™ and ARBOCELL™. Pertinent examples of fibrous cellulose filter aids are is Arbocel BFC200™ and Arbocel BC200™. Also synthetic fibres may be used as described in EP 304331 B1 and typical fibres may be made of polyethylene, polypropylene, polyester, especially nylon, polyvinylformate, poly(meth)acrylic compounds.
- Cross-linking agents such as enzyme-compatible surfactants, e.g. ethoxylated alcohols, especially ones with 10 to 80 ethoxy groups. These may both be found in the shell unit and in the enzyme core unit.
- Suspension agents, mediators (for boosting bleach action upon dissolution of the granule in eg a washing application) and and/or solvents may be incorporated as conventional granulating agents.
- Viscosity regulating agents. Viscosity regulating agents may be present in the core unit as a reminiscence from the preparation of the core unit

An important feature related to the smaller size of the core unit of the invention is that the volume, in which excipients are contained, is much smaller than the volume of known core units. Accordingly, for a calculated optimum concentration of an excipient in a core unit the absolute amount of excipient required to obtain this concentration is reduced. This feature

reduces the manufacturing costs of a granule of the invention, because excipients often are expensive speciality chemical.

The Shell Unit

5 The shell unit of the invention is thicker than known shell unit and have a preferred thickness of at least 25 μm . A more preferred thickness is at least 50 μm such as at least 75 μm , at least 100 μm , least 150 μm , least 200 μm , least 250 μm or most preferably at least 300 μm .

10 The shell unit comprises one or more conventional shell or coating components such as described in in WO 89/08694, WO 89/08695, 270 608 B1 and/or PA 1998 00876 (Danish priority application unpublished at the priority date of this invention). Other examples of conventional coating materials
15 may be found in US 4,106,991, EP 170360, EP 304332, EP 304331, EP 458849, EP 458845, WO 97/39116, WO 92/12645A, WO 89/08695, WO 89/08694, WO 87/07292, WO 91/06638, WO 92/13030, WO 93/07260, WO 93/07263, WO 96/38527, WO 96/16151, WO 97/23606, US 5,324,649, US 4,689,297, EP 206417, EP 193829, DE 4344215,
20 DE 4322229 A, DD 263790, JP 61162185 A and/or JP 58179492. Especially the salt coatings described in PA 1998 00876 are useful as a shell unit in the present invention.

The components comprised in the shell unit composition may be selected from the list of excipient described, *supra*, in the
25 "enzyme core unit" section. Further components may be selected the following non-limiting list of chlorine scavengers, plasticizers, pigments, lubricants (such as surfactants or antistatic agents) and fragrances.

Plasticizers useful in coating layers in the context of
30 the present invention include, for example: polyols such as sugars, sugar alcohols, or polyethylene glycols (PEGs) having a molecular weight less than 1000; urea, phthalate esters such as dibutyl or dimethyl phthalate; and water.

Suitable pigments include, but are not limited to, finely divided whiteners, such as titanium dioxide or kaolin, coloured pigments, water soluble colorants, as well as combinations of one or more pigments and water soluble colorants.

5 As used in the present context, the term "lubricant" refers to any agent which reduces surface friction, lubricates the surface of the granule, decreases tendency to build-up of static electricity, and/or reduces friability of the granules. Lubricants can also play a related role in improving the
10 coating process, by reducing the tackiness of binders in the coating. Thus, lubricants can serve as anti-agglomeration agents and wetting agents. Examples of suitable lubricants are polyethylene glycols (PEGs) and ethoxylated fatty alcohols.

In embodiments aimed primarily at detergent formulations,
15 different "functional" components could be added to the shell such as TAED, CMC, bleach, OBA, surfactants, perfume as well as other functional components used in detergent formulations known to the person skilled in the art. The shell may also optionally comprise functional components selected for their
20 specific use in the foodstuffs industry, baking industry, additives industry, feed industry, detergents industry or other industries where enzyme granules can be used.

In a preferred embodiment of the invention the granule of the invention is coated with a protective coating having a high
25 constant humidity such as described in the Danish patent application PA 1998 00876 pages 5-9 . which is hereby incorporated by reference. Accordingly the shell unit should, in certain embodiments, act as a moisture and/or bleach barrier to stabilise the enzyme activity in the core unit. Furthermore,
30 in alternative embodiments, the shell unit acts as a mechanical barrier during mechanical processes such as dosing or tableting. In certain embodiments, the shell unit is sufficiently compressible and flexible for the enzyme core unit to withstand a tableting process, both in a structural sense

and with regards to activity. This is potentially most applicable for detergent formulations.

The shell unit, in many ways, resembles conventional shell unit or coating layers surrounding an enzyme containing
5 core, except for the notable difference that it is thicker, preferably considerably thicker than known shell units. Also as opposed to conventional thin shell units, the shell unit of the invention contains very little enzyme. During preparation of an enzyme granule some of the enzyme in a core unit often
10 undesirably passes or diffuses into the shell unit and may even reach the outer surface of the granule. However, in the present invention the increased thickness of the shell unit reduces the relative amount of enzyme in the shell, so that the amount of enzyme per weight of shell may be kept very low. Also by
15 increasing the shell thickness the enzyme may be prevented from reaching the outer surface of the granule. Thus, the shell unit may be considered substantially free of enzymes in accordance with the definition used herein. The increased shell thickness of the invention reduces the amount of enzyme dust which may be
20 released when handling the granules in a dry form, eg. as determined in the well known Heubach test method.

The shell unit provides protection to the enzyme in the core unit, because it physically separates the environment of the core unit, in which the enzyme is usually stabilised, from the
25 environment surrounding the granule, which is usually hostile to the enzyme. Conventional thin shell units provides less protection, and it is necessary to incorporate expensive enzyme protecting agents in the shell unit, which neutralise harmful components, which penetrate from the surrounding environment
30 through the shell unit and into the core unit. By applying a thick shell unit this process is reduced, eg. by the distance between the core unit and the surrounding environment. In a preferred embodiment addition of enzyme protecting agents to the shell unit becomes obsolete and the shell unit is

substantially free of enzyme protecting agents. By using the term "substantially free" in this context it is meant that enzyme protecting agents is not intentionally added to the shell unit. However, enzyme protecting agents from the core unit may during preparation of a granule pass or diffuse from the core unit into the shell unit. Accordingly, the term means that the concentration of enzyme protecting agent in the shell unit is less than 10% w/w the concentration in the core unit. The shell unit will also protect the enzyme in the core unit, when products containing granules of the invention is processed, such as steam-pelletising of feeds. The high temperatures used in the steam process can, under certain conditions, denature the enzymes thus reducing or destroying their activity. The shell unit may comprise components that confer thermal-resistance to the shell unit or whose overall composition gives a shell unit that will melt at a temperature at which the enzyme is still fully stable. This will allow the temperature within the immediate environment of the enzyme to rise no higher than the melting point of the shell unit for a certain period of time (the time in question is also dependent on the thickness of the shell unit). Accordingly a shell unit suitable for protecting an enzyme in the core unit during a (steam) pelletising process should have a melting temperature or temperature range within 70-120°C.

An important feature of the shell unit of the invention is that the increased thickness and composition of the shell unit contributes to granule properties such as, the overall activity, size and density of the granule. Accordingly in the present invention the activity of the final granule, the size and the bulk density may be adjusted by variation in the composition and thickness of the shell unit. For a given core unit, thicker shell units and heavier shell unit compositions provides lower activity of the final granule, increased size and increased bulk density. This means that a wide range of

different granules useful for different purposes and applications may be prepared using only one type of core unit. This is achievable, because variations in a thick shell unit to adjust properties like activity, size and density of a granule is possible, without seriously deteriorating the mechanical, structural or protective properties of the shell unit.

The size of the shell unit may be altered to meet the needs of the manufacturer, depending on its purpose, be it detergents, foodstuff, baking agents, animal feed or any of the other uses known by the person skilled in the art.

Moreover, density is also an important feature of the enzyme granule. In for example a detergent formulation comprising enzyme granules, an inappropriate granule density leads to separation of the detergent components leading to inconsistent performance of the product. This is highly undesirable and this issue has received much focus.

The shell, in certain embodiments, can comprise several layers, each with a special function.

20 Process for preparing core units; shell units and granules

In ongoing research aimed at improving enzyme granulate formulations, with regards not only to granule properties, but also equally to process design and economy of design, a conceptually new preparation process for preparing small core units of high enzyme activity surrounded by a thick shell unit has been developed. Accordingly the invention relates to a process for preparing an enzyme containing granule having a core-shell configuration, comprising the step of coating an enzyme containing core with a shell, so that the ratio between the diameter of the granule and the diameter of the core unit is at least 1.1.

In this process the preparation of a core unit may be physically separated in time and location from the process of coating the, preferably substantially enzyme free shell unit on

the core unit and properties of the resulting granule may be adjusted and customised to specific applications by variation in the shell thickness and composition and by preparing core units having a narrow particle size distribution and a homogenous levels of enzyme.

When preparing enzyme granules of desired properties, a process wherein core units, which have a high or concentrated enzyme activity, are coated with a shell of an increased thickness offers several advantages:

10

- The core unit may be prepared independently of the process of applying the shell onto the core unit, because properties such as size, activity, density, colour, enzyme dust levels, odour, mechanical and physical strength etc. of the finished granule may be adjusted by the shell unit. This means that a wide range of different granules useful for different purposes and applications may be prepared using only few basic types of core units. The process of the invention provides huge logistic advantages because the core units may be prepared independently from the coating process, and may be stably transported and stored t suitable conditions as independent physical entities or product intermediates, which upon desire may be enclosed in a coating or shelling process to produce finished granule designed for a specific application. Storage conditions would preferably be where humidity levels and temperature are controllable or, where the enzyme cores are packaged, can be stabilised for e.g. in an airtight container. In fact there may be big differences in time and location between preparation of the core units and preparation of finished granules. The time difference or time span between preparing the core units and applying the shell unit for finishing the granules may be hours (1-24 hours), days (1-7 days), weeks (1-52 weeks) and even years (1-5 years), and the process provide for preparation of the

30

core units in one geographical area (e.g. one country) and finishing granule in another geographical area (e.g. another country). Accordingly the storage stable core units may easily be shipped at low costs to a local finishing site for application of a shell unit which meets the specific needs of the intended local market. Also the concentrated enzyme core units provide reduced storage requirements, and reduced environmental risk in the packaging, shipping and handling.

10 • As many of the properties of the finished granule are conferred to the granule in the coating or shelling process methods for preparing core units may be chosen or developed which provides a narrow particle size distribution of the core units. Accordingly the process provides for reduced loss of enzyme activity during preparation, because the need for further processing of the core units such as sieving, separating and re-circulating of over and under sized cores is reduced. Recycling processes are costly and incurs loss of active enzyme.

20

- Energy savings are obtained by reducing recycling.

- Production capacity is increased with decreasing recycle ratios.

25

- Improved activity control. Once the activity and size of core units is determined, the activity and size of a finished granule may easily be estimated on-line by measuring the size of the finished granule.

30

- Improved homogeneity in the finished granule activity.

Preparation of core units

The enzyme cores of the invention may be produced using techniques known per se in the art. Non-limiting examples of suitable techniques are spray cooling, spray drying, melt granulation and high shear granulation. A combination of more than one of these techniques may also be employed.

In one embodiment, the process for preparing core units is a spray cooling process. A spray cooling process is one wherein an enzyme is dispersed and/or dissolved in a molten substance at a temperature such as not to denature the enzyme, and this mixture is cooled to solidify the substance incorporating the enzyme. The substance is preferably organic, and has a melting temperature or melting temperature range within 20-150°C, preferably between 35-80°C h. Such substances are frequently termed a "wax" (see Michael S. Showell (editor); *Powdered detergents*; Surfactant Science Series; 1998; vol. 71; page 140-142; Marcel Dekker).

In a spray cooling process solidification of the mixture of enzyme in melted wax is achieved by atomising the mixture into droplets and solidifying the droplets in a stream of cooling air, typically in a cooling tower, whereby enzyme core unit particles having a narrow PSD can be obtained.

The enzyme may be applied to the molten wax by mixing a preferably purified crystalline or amorphous enzyme (such as described in WO 91/09943) into the molten wax. In a more preferred embodiment the enzyme and optionally other components are in a dry powder form such as spray dried products, which is dispersed or suspended in the molten wax. Atomization of the molten wax may be achieved in a number of way, where amongst it is preferred to perform the atomization using either a high speed rotating disk atomizer, a pressure nozzle, a pneumatic nozzle or a sonic nozzle such as described in the Course Material from the Microencapsulation Seminar, held by Center for professional advancement on May 9 to May 11, 1990 in Amsterdam. The solidification of the droplets by cooling may

advantageously be performed in a cooling container such as a tower, wherein the atomized dispersion or solution of enzyme in molten wax is introduced into a cold air stream in the top of the tower, and the solidification of the droplets occurs while the droplets passes through the cold air stream towards the bottom of the tower. The mixture of molten wax, enzyme and optionally other components is preferably fed to the atomizer at a temperature at least 30 °C above the temperature at which the solidification commences, in order to avoid unintended solidification and blockage in feed pipes and atomizer. The quantity and temperature of air used for cooling the molten wax mixture should be adjusted so that is able of removing sufficient heat from the molten wax mixture to enable solidification (sensible heat of the liquid, latent heat of fusion of the solid and sensible heat of the solid). In a preferred embodiment the temperature of air leaving the cooling tower is about 5°C below the temperature of solid particles leaving the cooling tower.

The technique of spray cooling or spray chilling is well known to the art, and may be performed using well known equipment such as described in K. Masters, Applications in the chemical industry, section 14.10.1, pp 565-566, Spray drying Handbook, 3'edition 1979 George Goodwin Ltd. London ISBN 0-7114-4924-4/John Wiley & Sons, New York.

A preferred special atomiser is a Rayleigh atomiser with which a particularly narrow particle size distribution may be obtained. One such atomiser is described in WO 94/21383. This atomiser allows for a process in which the amount of core units that must be reprocessed. Although a spray cooling process is a very energy efficient process in that the heat of melting is much smaller than the heat of evaporation, it is not desirable to have any significant recycling of product due to capacity limitations and the risk of possible loss of enzymatic activity.

As an alternative core units may also be prepared by a process comprising making a dispersion of enzyme and optionally other components in a molten wax, letting the wax solidify and milling/crushing the solidified wax incorporating the enzyme particles and optionally rounding the particles, e.g. in a marumerizer.

Another preferred alternative of preparing a wax based core unit is a process comprising

- (a) dispersing or dissolving an enzyme in a molten wax,
- 10 (b) transferring the dispersion to a liquid phase, e.g. an oil, in which both the enzyme and the wax are immiscible,
- (c) forming an emulsion of small droplets of enzyme-wax dispersion in the liquid phase,
- (d) cooling the liquid phase and the enzyme-wax droplets to
15 solidify the wax into particles,
- (e) isolating the particles from the liquid phase.

Another possible embodiment to produce the enzyme core unit is a special spray drying process using the same or
20 similar type of atomiser as the Spray cooling process. This only requires a spray drying tower sufficiently large to allow the relatively large droplets to dry to the desired enzyme core size. This process route will result in a very efficient process; both with regards to energy and monetary investment.

25 In another embodiment of the invention, the enzyme core unit is produced by a melt granulation process. Melt granulation processes are known to the person skilled in the art (see *Melt agglomeration with polyethylene glycols in high shear mixers*, Torben Schæfer, The Royal Danish School of
30 Pharmacy, 1996). It is may be preferred to add melt binder to the enzyme process prior to spray drying.

The enzyme core may be produced by a high shear granulation process in which the spray dried enzyme powder as produced by any of the preceding methods is mixed with

components such as cellulose, dextrans, and sulfates before being transferred to a high shear mixer. A binder solution and sugar may be added in water until a desired mean particle size is achieved.

5 The enzyme core units can either be utilised directly after the preparation or they may be stored as an intermediate product, which can be processed later at the same production site or shipped to other specialised production sites, where several different products may be produced from the same enzyme
10 core. This process is consequently very flexible compared to prior art, where only one product type might be produced at one time. In addition, the minimum feasible batch size is much smaller in the enzyme core process due to the small product hold-ups in the process. In one embodiment of the process, a
15 thin film is applied to the enzyme core unit prior to shipping, storage, or immediate further processing to the final granule. The film layer can in certain embodiments aid in the subsequent shell coating step by comprising materials aiding in adhesion.

20 Application of shell units

Formation and application of the shell unit may also be performed using techniques known *per se* in the art, e.g. a mechanical coating process and/or a fluid bed coating process.

 The coating step, i.e. addition of the shell to the
25 enzyme core is either done as a pure mechanical coating process, wherein the core unit is mixed with the coating material in a mixer, such as in a Pan granulator, or by a combined mechanical coating and a fluid bed coating process. Both of these processes can be utilised, e.g. first fluid bed
30 coating to enhance the enzyme core size up to a certain minimum size followed by a mechanical layering process to reach the final size, or just one of them can be utilised. In preferred embodiments of the coating process, the internal parts of the shell are produced in a fluid bed process.

A mechanical coating process may also be combined with a fluid bed drying step to enhance the production rate.

Application of enzyme granules

5 The invention also relates to compositions comprising the enzyme granule of the invention. The composition may be any composition, but preferred compositions are those intended for such in the food, baking and/or detergent industry. Accordingly the composition may be a food, bakers flour, dough or detergent
10 composition or an additive to be incorporated in such compositions. Also the invention encompasses the use of the composition, e.g. for improving foodstuffs such as bread or for cleaning an object such as a cellulose containing fabric.

 The enzyme granule, as stated above, can find application
15 in a variety of industries. Moreover, within each industry, the granule can be customised to suit the needs of the manufacturer, the needs of the market, the needs of the end-user and the "cultural/societal" habits of local markets. One such example of customising the overall formulation of the
20 granule to suit specific needs is for an enzyme granule that can be manipulated late in the manufacturing and processing stage in the detergents industry. The Japanese market requires a granule effective and amenable to cold water washing for short periods of time; the American market requires a granule
25 effective and amenable to structured liquid formulations and hot tap-water temperatures; the European market requires a granule effective and amenable to hot washing temperatures and long washing times; the Southeast Asian and Asian markets requires a granule effective and amenable to hand washing using
30 soap bars. All of these markets can be catered to more appropriately if the shell unit and final formulation are done separately or even locally. The present invention allows for this by preparing the enzyme cores independently allowing for

shipping them to a multitude of processing plants to serve the multitude of requirements of specific markets.

Detergent Compositions

5 The enzyme granule of the invention may be added to and thus become a component of a detergent composition.

 The detergent composition of the invention may for example be formulated as a hand or machine laundry detergent composition including a laundry additive composition suitable
10 for pre-treatment of stained fabrics and a rinse added fabric softener composition, or be formulated as a detergent composition for use in general household hard surface cleaning operations, or be formulated for hand or machine dishwashing operations.

15 In a specific aspect, the invention provides a detergent additive comprising the enzyme of the invention. The detergent additive as well as the detergent composition may comprise one or more other enzymes such as a protease, a lipase, a cutinase, an amylase, a carbohydrase, a cellulase, a pectinase, a
20 mannanase, an arabinase, a galactanase, a xylanase, an oxidase, e.g., a laccase, and/or a peroxidase.

 In general the properties of the chosen enzyme(s) should be compatible with the selected detergent, (i.e. pH-optimum, compatibility with other enzymatic and non-enzymatic
25 ingredients, etc.), and the enzyme(s) should be present in effective amounts.

Proteases: Suitable proteases include those of animal, vegetable or microbial origin. Microbial origin is preferred. Chemically modified or protein engineered mutants are included.
30 The protease may be a serine protease or a metallo protease, preferably an alkaline microbial protease or a trypsin-like protease. Examples of alkaline proteases are subtilisins, especially those derived from *Bacillus*, e.g., subtilisin Novo, subtilisin Carlsberg, subtilisin 309, subtilisin 147 and

subtilisin 168 (described in WO 89/06279). Examples of trypsin-like proteases are trypsin (e.g. of porcine or bovine origin) and the *Fusarium* protease described in WO 89/06270 and WO 94/25583.

5 Examples of useful proteases are the variants described in WO 92/19729, WO 98/20115, WO 98/20116, and WO 98/34946, especially the variants with substitutions in one or more of the following positions: 27, 36, 57, 76, 87, 97, 101, 104, 120, 123, 167, 170, 194, 206, 218, 222, 224, 235 and 274.

10 Preferred commercially available protease enzymes include Alcalase™, Savinase™, Primase™, Duralase™, Esperase™, and Kannase™ (Novo Nordisk A/S), Maxatase™, Maxacal™, Maxapem™, Properase™, Purafect™, Purafect OxP™, FN2™, and FN3™ (Genencor International Inc.).

15 Lipases: Suitable lipases include those of bacterial or fungal origin. Chemically modified or protein engineered mutants are included. Examples of useful lipases include lipases from *Humicola* (synonym *Thermomyces*), e.g. from *H. lanuginosa* (*T. lanuginosus*) as described in EP 258 068 and EP 305 216 or from
20 *H. insolens* as described in WO 96/13580, a *Pseudomonas* lipase, e.g. from *P. alcaligenes* or *P. pseudoalcaligenes* (EP 218 272), *P. cepacia* (EP 331 376), *P. stutzeri* (GB 1,372,034), *P. fluorescens*, *Pseudomonas* sp. strain SD 705 (WO 95/06720 and WO 96/27002), *P. wisconsinensis* (WO 96/12012), a *Bacillus* lipase,
25 e.g. from *B. subtilis* (Dartois et al. (1993), *Biochemica et Biophysica Acta*, 1131, 253-360), *B. stearrowthermophilus* (JP 64/744992) or *B. pumilus* (WO 91/16422).

Other examples are lipase variants such as those described in WO 92/05249, WO 94/01541, EP 407 225, EP 260 105,
30 WO 95/35381, WO 96/00292, WO 95/30744, WO 94/25578, WO 95/14783, WO 95/22615, WO 97/04079 and WO 97/07202.

Preferred commercially available lipase enzymes include Lipolase™ and Lipolase Ultra™ (Novo Nordisk A/S).

Amylases: Suitable amylases (α and/or β) include those of bacterial or fungal origin. Chemically modified or protein engineered mutants are included. Amylases include, for example, α -amylases obtained from *Bacillus*, e.g. a special strain of *B. licheniformis*, described in more detail in GB 1,296,839.

Examples of useful amylases are the variants described in WO 94/02597, WO 94/18314, WO 96/23873, and WO 97/43424, especially the variants with substitutions in one or more of the following positions: 15, 23, 105, 106, 124, 128, 133, 154, 156, 181, 188, 190, 197, 202, 208, 209, 243, 264, 304, 305, 391, 408, and 444.

Commercially available amylases are DuramylTM, TermamylTM, FungamylTM and BANTM (Novo Nordisk A/S), RapidaseTM and PurastarTM (from Genencor International Inc.).

Cellulases: Suitable cellulases include those of bacterial or fungal origin. Chemically modified or protein engineered mutants are included. Suitable cellulases include cellulases from the genera *Bacillus*, *Pseudomonas*, *Humicola*, *Fusarium*, *Thielavia*, *Acremonium*, e.g. the fungal cellulases produced from *Humicola insolens*, *Myceliophthora thermophila* and *Fusarium oxysporum* disclosed in US 4,435,307, US 5,648,263, US 5,691,178, US 5,776,757 and WO 89/09259.

Especially suitable cellulases are the alkaline or neutral cellulases having colour care benefits. Examples of such cellulases are cellulases described in EP 0 495 257, EP 0 531 372, WO 96/11262, WO 96/29397, WO 98/08940. Other examples are cellulase variants such as those described in WO 94/07998, EP 0 531 315, US 5,457,046, US 5,686,593, US 5,763,254, WO 95/24471, WO 98/12307 and PCT/DK98/00299.

Commercially available cellulases include CelluzymeTM, and CarezymeTM (Novo Nordisk A/S), ClazinaseTM, and Puradax HATM (Genencor International Inc.), and KAC-500(B)TM (Kao Corporation).

Peroxidases/Oxidases: Suitable peroxidases/oxidases include those of plant, bacterial or fungal origin. Chemically modified or protein engineered mutants are included. Examples of useful peroxidases include peroxidases from *Coprinus*, e.g. from *C. cinereus*, and variants thereof as those described in WO 93/24618, WO 95/10602, and WO 98/15257.

Commercially available peroxidases include Guardzyme™ (Novo Nordisk A/S).

The detergent enzyme(s) may be included in a detergent composition by adding separate additives containing one or more enzymes, or by adding a combined additive comprising all of these enzymes. A detergent additive of the invention, i.e. a separate additive or a combined additive, is formulated so as to contain one or more of the enzyme granules of the invention.

The detergent composition of the invention may be in any convenient form, e.g., a bar, a tablet, a powder, a granule, a paste or a liquid. A liquid detergent may be aqueous, typically containing up to 70 % water and 0-30 % organic solvent, or non-aqueous.

The detergent composition comprises one or more surfactants, which may be non-ionic including semi-polar and/or anionic and/or cationic and/or zwitterionic. The surfactants are typically present at a level of from 0.1% to 60% by weight.

When included therein the detergent will usually contain from about 1% to about 40% of an anionic surfactant such as linear alkylbenzenesulfonate, alpha-olefinsulfonate, alkyl sulfate (fatty alcohol sulfate), alcohol ethoxysulfate, secondary alkanesulfonate, alpha-sulfo fatty acid methyl ester, alkyl- or alkenylsuccinic acid or soap.

When included therein the detergent will usually contain from about 0.2% to about 40% of a non-ionic surfactant such as alcohol ethoxylate, nonylphenol ethoxylate, alkylpolyglycoside, alkyldimethylamineoxide, ethoxylated fatty acid monoethanolamide, fatty acid monoethanolamide, polyhydroxy alkyl fatty acid

amide, or N-acyl N-alkyl derivatives of glucosamine ("glucamides").

The detergent may contain 0-65 % of a detergent builder or complexing agent such as zeolite, diphosphate, triphosphate, 5 phosphonate, carbonate, citrate, nitrilotriacetic acid, ethylenediaminetetraacetic acid, diethylenetriaminepentaacetic acid, alkyl- or alkenylsuccinic acid, soluble silicates or layered silicates (e.g. SKS-6 from Hoechst).

The detergent may comprise one or more polymers. 10 Examples are carboxymethylcellulose, poly(vinylpyrrolidone), poly(ethylene glycol), poly(vinyl alcohol), poly(vinylpyridine-N-oxide), poly(vinylimidazole), polycarboxylates such as polyacrylates, maleic/acrylic acid copolymers and lauryl methacrylate/acrylic acid copolymers.

15 The detergent may contain a bleaching system which may comprise a H_2O_2 source such as perborate or percarbonate which may be combined with a peracid-forming bleach activator such as tetraacetythylenediamine or nonanoyloxybenzenesulfonate. Alternatively, the bleaching system may comprise peroxyacids of 20 e.g. the amide, imide, or sulfone type.

The enzyme(s) of the detergent composition of the invention may be stabilized using conventional stabilizing agents, e.g., a polyol such as propylene glycol or glycerol, a sugar or sugar alcohol, lactic acid, boric acid, or a boric acid 25 derivative, e.g., an aromatic borate ester, or a phenyl boronic acid derivative such as 4-formylphenyl boronic acid, and the composition may be formulated as described in e.g. WO 92/19709 and WO 92/19708.

The detergent may also contain other conventional 30 detergent ingredients such as e.g. fabric conditioners including clays, foam boosters, suds suppressors, anti-corrosion agents, soil-suspending agents, anti-soil redeposition agents, dyes, bactericides, optical brighteners, hydrotropes, tarnish inhibitors, or perfumes.

It is at present contemplated that in the detergent compositions any enzyme, in particular the enzyme of the invention, may be added in an amount corresponding to 0.01-100 mg of enzyme protein per liter of wash liquor, preferably 0.05-5 mg of enzyme protein per liter of wash liquor, in particular 0.1-1 mg of enzyme protein per liter of wash liquor.

The enzyme of the invention may additionally be incorporated in the detergent formulations disclosed in WO 97/07202 which is hereby incorporated as reference.

10

EXAMPLES

The invention is illustrated by the following unlimiting examples.

15

Example 1:

3 kg of Savinase® enzyme (a protease enzyme available from Novo Nordisk A/S - Denmark) concentrate with a solids content of 33 % w/w was added 10 % w/w of a dextrin binder. The enzymatic activity was approximately 98 KNPu/g in this mixture. The mixture was spray dried in a MobileMinor lab spray dryer using an 175 °C inlet air temperature, a 60 °C outlet air temperature and co-current atomization by a two-fluid nozzle to obtain a powder with an average particle size of about 20 µm. The obtained powder had an enzymatic activity of approximating 264 KNPu/g.

The obtained powder is dispersed into 1 kg of melted PEG4000 at a temperature of 58 to 60 °C. The dispersion is spray cooled by atomising it in a spray cooling tower using a high speed rotational atomiser running at 9000 RPM. The obtained core units is screened to separate the fraction between 200 to 225 µm.

Example 2:

Example 1 is repeated except for using a Rayleigh atomiser as disclosed in WO 94/21383, example 1, page 19, lines 12-36 in the spray cooling step.

5

Example 3:

Example 1 was repeated except for the spray cooling step, which was replaced by a melt granulation process and the enzyme powder was replaced with a commercially available spray dried
10 soy protein powder (Soy-Co-Mill). 350 g of this powder was mixed with 95 g PEG 4000 chips and was added to a vertical high shear mixer (Mi-Mi-Pro from Pro-c-ept NV, Belgium). The powder temperature was raised to 66 °C using 1500 rpm impeller speed and 5600 rpm chopper speed. The obtained enzyme core particles
15 was very compact and spherical, which greatly improves the later coating steps where the shell is supplied. A small amount of not agglomerated powder may stick to the surface of the particles if they are allowed to solidify in a non-moving system. Consequently, it will be preferred industrially to use
20 a fluid bed cooler to solidify and to classify the obtained enzyme cores units.

Example 4

Example 3 is repeated with the exception that the soy protein
25 powder is replaced by a spray dried enzyme powder made as in example 1, wherein the dextrin binder added to the enzyme concentrate before spray drying is replaced by PEG 4000. This gives an efficient way of distributing a melt binder into the a spray dried powder before the melting and mixing process.

30

Example 5

Example 1 is repeated except for the spray cooling step which was replaced by a high shear granulation process in which the spray dried enzyme powder is mixed with cellulose fibres, 10 %

by weight of the resulting core unit of dry dextrin binder. Sodium sulfate salt is added so that cellulose fibres and binder each constitutes 10 % by weight of the powder mixture. This mixture is transferred to a horizontal 50 L high shear mixer and mixed at under addition of a binder solution of having 5 % w/w dextrin and 5 % w/w sugar in water solution until a mean particle size of about 200 μm was achieved. The wet core units is subsequently dried in a fluid bed using 90 °C inlet temperature until the product temperature reached 60 °C. 10 The dried product is screened to obtain core units in the range from 180 μm to 250 μm . The resulting enzymatic activity will be approximately 14 KNPu/g.

Example 6

15 Example 1 was repeated except for the spray cooling step which was replaced by a process wherein 100 g of the spray dried powder was dispersed into 100 g of a melted PEG4000 wax. This dispersion was subsequently emulsified using an Ultra Turrax blender into about one litre of mineral oil (Whiteway T15) 20 heated to 65 °C. The size of the formed droplets of enzyme-wax dispersion in oil was controlled by the speed of the blender and the addition of an emulsifying agent (SPAN 80 which is a Sorbitan mono-9-octadecenoate (Monoester of oleic acid and hexitol anhydrides derived from sorbitol). When the desired 25 droplet size was achieved the oil was cooled to ambient temperature, and the solidified particle were filtered from the oil. The formed core unit is calculated to about 132 KNPu/g. The obtained enzyme core particles was very compact and a large number of these are perfect spheres, which greatly improves the 30 later coating steps where the shell is supplied. This is due to the long time available for the surface tension to form the shape of the particle and the very low shear excerpted on the droplet during solidification.

Example 7:

A charge of 8 kg enzyme core produced as described in Example 5 was added to a fluid bed coater (Aeromatic-Fielder Precision Coater, Size MP 2/3) to study the feasibility of such a fluid bed process for the initial coating of enzyme core. The aim of this study is to test the feasibility of the process to coat such a small enzyme cores without any agglomeration.

The initial properties of enzyme core were:

Property	value
D10	185 μ m
D50	218 μ m
D90	251 μ m
Span	0.30
Bulk density	0,797 g/ml
Tapped density	1,10 g/ml
Particle density	2,22 g/ml
Savinase® activity	14,32 KNPU/g

10

In the process following coating layers are applied:

Coating layers	Amount applied
additional enzyme layer	2537 g
2. layer : sodium sulphate + water	7850 g
3. layer: HPMC + PEG400 + water	1600 g
4. layer : PEG 4000 + water	250 g

The processing conditions applied: 125 °C inlet air temperature and 50 °C product temperature.

15

The final properties of the coated enzyme core were:

Property	value
----------	-------

D10	190 μm
D50	241 μm
D90	291 μm
Span	0.42
Bulk density	1,00 g/ml
Tapped density	1,05 g/ml
Particle density	1,82 g/ml
Savinase activity	15,00

The tapped density is measured by tapping a known mass of powder in a rigid container a specified number of times (typically 100 - 1000 times) and measuring the final volume of the powder. The tapped density is the ratio of the volume to the mass. The tapping is done by letting the powder container freely fall a specified distance (1 -10 mm) on a hard surface. HPMC is Hydroxy-propyl-methyl-cellulose.

The results shows that it is surprisingly possible to coat such small core units without the core units agglomerating in the process.

CLAIMS

1. An enzyme-containing granule comprising a core unit and a shell unit, wherein the core unit comprises the enzyme and is enclosed in a shell unit which is substantially enzyme-free, the ratio between the diameter of the granule and the diameter of the core unit being at least 1.1.
2. An enzyme-containing granule of claim 1, wherein the ratio between the diameter of the granule and the diameter of the core unit is at least about 1.5, preferably at least about 2, more preferably at least about 3, most preferably at least about 4, and preferably below about 100, preferably below about 50, more preferably below 25, and most preferably below 10, e.g. in the range of from about 4 to about 6.
3. An enzyme-containing granule of claim 1 or 2, wherein the size of the enzyme core unit, in terms of its diameter in its longest dimension, is no more than 1000 μm , preferably no more than 700 μm or 600 μm , preferably between 100 and 500 μm , such as between 100 and 400 μm , preferably between 200 and 300 μm .
4. An enzyme-containing granule of any of the preceding claims, wherein the size of the core unit, in terms of its relative mass compared to the overall mass of the granule, is up to about 30%, such as up to about 20%, such as up to about 15%, preferably up to about 10%, such as up to about 5%.
5. An enzyme-containing granule of any of the preceding claims, wherein the enzyme content in the core unit, calculated as pure enzyme protein, is in the range of from about 20% to 100% by weight of the enzyme core unit, preferably no less than 25%, such as no less than 30%, 35%, 40%, 45%, 50%, 55%, 60%, 65%, 70%, 75%, 80%, 85%, 90%, or 95% by weight.

6. An enzyme-containing granule of any of the preceding claims, wherein the enzyme is homogeneously dispersed within the enzyme core unit.

5

7. An enzyme-containing granule of any of claims 1-5, wherein the granule is a co-granule comprising more than one type of enzyme.

10 8. An enzyme-containing granule of claim 7, wherein the granule comprises a structured core unit such as a multi-layered core unit or a clustered-particle core unit.

9. An enzyme-containing granule of any of the preceding claims,
15 further comprising a film layer around the core unit to protect the core unit from components present in the shell unit.

10. A granulated enzymatic product comprising a multiplicity of enzyme granules of any of claims 1-9, wherein the enzyme core
20 units have a particle size distribution such that the ratio $(D_{90} - D_{10})/D_{50}$ is not more than about 2.5, preferably not more than about 2.0, more preferably not more than about 1.5, most preferably not more than about 1.0.

25 11. A process for preparing an enzyme-containing granule having a core-shell configuration, comprising the steps of providing an enzyme-containing core unit, and coating the core unit with a shell which is substantially enzyme-free, so that the ratio between the diameter of the granule and the diameter of the
30 core unit is at least 1.1.

12. The process of claim 11, wherein the ratio between the diameter of the granule and the diameter of the core unit is at least about 1.5, preferably at least about 2, more preferably

at least about 3, most preferably at least about 4, and preferably below about 100, preferably below about 50, more preferably below 25, and most preferably below 10, e.g. in the range of from about 4 to about 6.

5

13. The process of claim 11 or 12, wherein the size of the enzyme core unit, in terms of its diameter in its longest dimension, is no more than 1000 μm , preferably no more than 700 μm or 600 μm , preferably between 100 and 500 μm , such as
10 between 100 and 400 μm , preferably between 200 and 300 μm .

14. The process of any of claims 11-13, wherein the size of the core unit, in terms of its relative mass compared to the overall mass of the granule, is up to about 30%, such as up to
15 about 20%, such as up to about 15%, preferably up to about 10%, such as up to about 5%.

15. The process of any of claims 11-14, wherein the enzyme content in the core unit, calculated as pure enzyme protein, is
20 in the range of from about 20% to 100% by weight of the enzyme core unit, preferably no less than 25%, such as no less than 30%, 35%, 40%, 45%, 50%, 55%, 60%, 65%, 70%, 75%, 80%, 85%, 90%, or 95% by weight.

25 16. The process of any of claims 11-15, wherein the enzyme is homogeneously dispersed within the enzyme core unit.

17. The process of any of claims 11-15, wherein the granule is a co-granule comprising more than one type of enzyme.

30

18. The process of claim 17, wherein the granule comprises a structured core unit such as a multi-layered core unit or a clustered-particle core unit.

19. The process of any of claims 11-18, further comprising, prior to application of the shell unit, forming a film layer around the core unit to protect the core unit from components present in the shell unit.

20. The process of any of claims 11-19, comprising forming a multiplicity of enzyme granules wherein the enzyme core units have a particle size distribution such that the ratio $(D_{90} - D_{10})/D_{50}$ is not more than about 2.5, preferably not more than about 2.0, more preferably not more than about 1.5, most preferably not more than about 1.0.

21. The process of any of claims 11-20, wherein the enzyme core is formed using a spray cooling process, a spray drying process, a melt granulation process and/or a high shear granulation process.

22. The process of claim 21, wherein the enzyme core is formed using a process comprising

- (a) dispersing or dissolving an enzyme in a molten wax,
- (b) transferring the dispersion to a liquid phase, in which both the enzyme and the wax are immiscible,
- (c) forming an emulsion of small droplets of the enzyme-wax dispersion in the liquid phase,
- (d) cooling the liquid phase and the enzyme-wax droplets to solidify the wax into particles,
- (e) isolating the particles from the liquid phase.

23. The process of any of claims 11-22, wherein the shell unit is formed using a mechanical coating step optionally combined with a fluid bed drying step.

24. The process of any of claims 11-23, wherein the core unit is produced in a first step and then stored and/or shipped prior to subsequent formation of the shell unit in a second step, the enzyme core unit optionally being coated with a film layer prior to storage and/or shipping.

25. The process of claim 24, wherein the time span between the first step of producing the core unit and the second step of formation of the shell unit is 1 to 24 hours, preferably 1 to 7 days.

26. A composition comprising enzyme-containing granules of any of claims 1-10.

27. The composition of claim 26, wherein the composition is a bakers flour or a dough additive.

28. The composition of claim 26, wherein the composition is a feed additive.

29. The composition of claim 26, wherein the composition is a detergent additive.

30. The composition of claim 26, wherein the composition is a bakers flour or a dough.

31. The composition of claim 26, wherein the composition is a feed.

32. The composition of claim 26, wherein the composition is a detergent.

33. Use of the enzyme-containing granule of any of claims 1-10 for improving a bread.

34. Use of the enzyme-containing granule of any of claims 1-10 for improving a feed.

s 35. Use of the detergent composition of claim 32 for cleaning an object.

ABSTRACT

The invention relates to An enzyme-containing granule comprising a core unit and a shell unit, wherein the core unit comprises the enzyme and is enclosed in a shell unit which is substantially enzyme-free, the ratio between the diameter of the granule and the diameter of the core unit being at least 1.1. Also processes for producing such granules and use of the granules are disclosed.
